SPF byte-language pilot: learning, arithmetic and carrier effects
Exploratory observations; no architecture winner certified
A. Every candidate future, including rejections
× = restored candidate
Feedback bits per byte (lower is better)
Attempted training bytes (thousands)
SPF reference
Mamba v1
Transformer pilot
B. Frozen test observations — three seeds
Unequal exposure; anchors use the full train span
Bits per byte (lower is better)
Full-train unigram anchor
Full-train bigram anchor
SPF reference
Mamba v1
Transformer pilot
C. Native arithmetic drift on one shared window
packed
clocked
Native minus reference bits per byte
Context length (bytes)
D. Frozen history deletion — eight feedback windows
Dots = paired windows; negative = reset helps
Deleted minus ordinary bits per byte
Seed 17
Seed 29
Seed 43
